

HealthSync Fitness, Workout & Nutrition Seed Pack

Database-ready starter library with 2000+ original exercise/activity rows, premade plans, nutrition templates, safety rules and muscle-map asset strategy.

This pack is not a medical device, diagnosis, treatment plan or professional prescription. Pregnancy, postpartum, baby, child, teen, medical, allergy and advanced training content must be reviewed by qualified professionals before production.

Full Body

1. What is included

Content area	Rows / files
Exercises and activities	2450
Premade workout plans	63
Plan day schedule rows	1988
Nutrition templates	312
Goal progressions	10
Safety rules	10
Muscle-map images	20

The exercise rows include adults, men/women as unisex movement patterns, pregnancy/postpartum adaptations, children, teens, young adults and baby developmental play. Baby entries are not workouts - they are safe supervised play concepts only.

2. Recommended database architecture

Use the included Supabase SQL schema as your starting point: fitness_exercises, fitness_workout_programs, fitness_workout_program_days, fitness_nutrition_templates, fitness_goal_progressions, fitness_safety_rules and content_licenses. Keep license and professional-review metadata on every item.

3. Muscle map strategy

Instead of storing thousands of static images, store layer ids such as chest, lats, glutes, quads and calves. Each exercise can light up the relevant muscle layers. This supports your heat-map idea, recovery load, last-7-days decay and interactive body views.

4. Safety key points

- Adults: use gradual progression, form first, and recovery tracking. Advanced / insane training is adult-only with readiness checks.
- Pregnancy: default to low-impact moderate exercise, avoid breath-holding, overheating, contact/fall risk, and warning symptoms; require professional review.
- Postpartum: return through breathing, walking, core coordination and gentle strength only after clearance and symptom checks.
- Babies: developmental play only; awake and supervised; no forced movement, added load or supplement prompts.
- Children/teens: technique, fun and supervision first. No max lifts, no stimulant/pre-workout/fat-burner/protein-powder prompts.
- Nutrition: use USDA FoodData Central for nutrient values, store allergens and diet preferences, and review pregnancy/child/medical recommendations.

5. Goal training examples

Goal	Safe progression logic
Run 5km from 100m	Use walk/run intervals. Add 50-150m total running per session when pain-free and breathing recovers. Deload every fourth week.
Bench 20kg to 50kg	Use 2-3 bench sessions/week, upper back support work and small 1.25-2.5kg jumps only after two clean sessions.
Weight loss	Use small energy deficit, steps, strength training, sleep and high-fiber whole foods; avoid aggressive deficits for pregnancy, children or medical users.

6. Media and licensing notes

Do not scrape and repackage third-party websites. Use original text, wger/API-based content with per-item license metadata, public-domain/CC assets, and your own branded media. YouTube should be embedded through the official player and Creative Commons videos still require attribution and license checks.

Source	Use in this project
wger	Open-source workout/fitness API structure; check license per item.
MuscleMap	MIT-licensed SwiftUI muscle map reference; use license notice if adopting.
USDA FoodData Central	CC0/public-domain nutrition data source for nutrient values.
CDC physical activity guidelines	Baseline activity recommendations for adults, children and pregnancy/postpartum.
AAP HealthyChildren	Children/teen supplement caution source.
YouTube policies	Use official embeds; verify CC BY or permissions; store attribution.

Next step: import the CSVs into staging tables, filter anything marked `requires_pregnancy_professional_review` / `requires_pediatric_review`, then approve only reviewed rows for public app use.
